# #1 About Database

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

Institut für  
Verkehrsplanung  
und Verkehrstechnik  
TU Darmstadt

What is a Database?

An organized collection of structured data, stored electronically.  
Managed by a Database Management System (DBMS).

Database System

The combination of database + DBMS + applications.

Why are Databases Important?

Efficiently handle **large and diverse** amounts of data.  
Allow data to be **stored systematically** and **easily retrieved, filtered, sorted, and updated** accurately.

# #2 Relational Database

## Relational Databases

Organize data into **tables** with **rows** and **columns**.

Tables are grouped in **schemas** (containers/namespaces inside a database).

For **every column**, the schema defines the **allowed values** (e.g. Year is an **integer**).

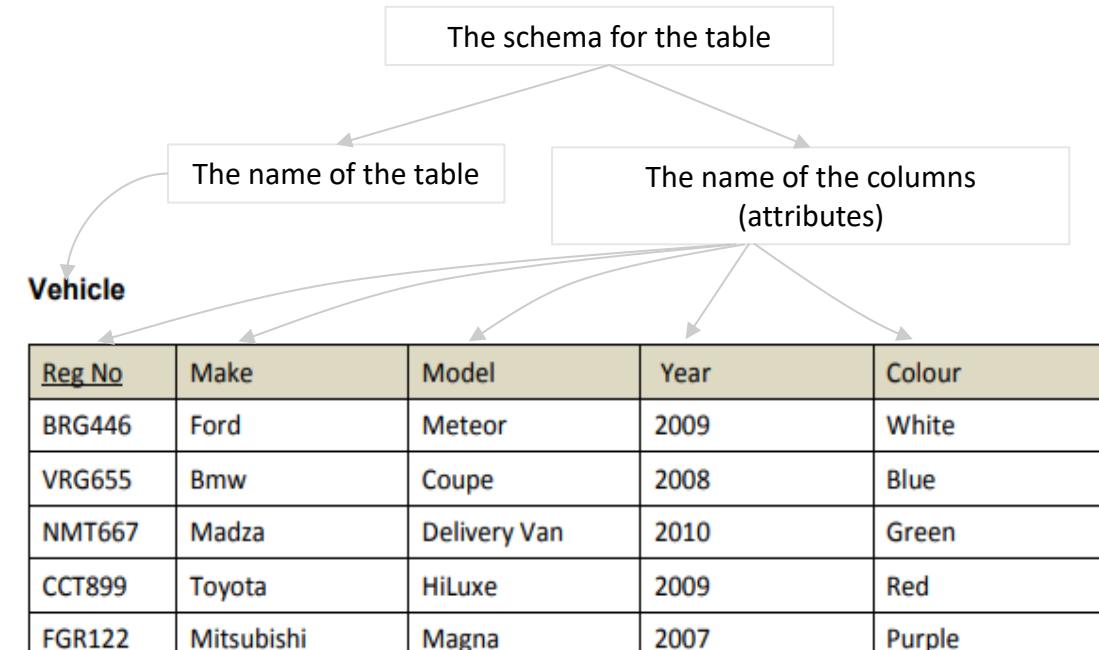

This set of allowed values is the column's **domain or data type**.

Structure is crucial: every row (e.g. each car) has the **same attributes/columns** - that's the **schema**.

The **schema stays fixed**, but **rows change** as we add or update data.

**SQL (Structured Query Language)** manages data in relational databases.

Invented in **1974** at **IBM** and still the **standard way** to access relational data.

Imagine that this table (or relation) has been defined to keep track of vehicles in a company

# #2 Relational Database

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

Institut für  
Verkehrsplanung  
und Verkehrstechnik  
TU Darmstadt

Table: Artists

| ArtistID | Name             | BirthYear | Nationality |
|----------|------------------|-----------|-------------|
| 1        | Vincent van Gogh | 1853      | Dutch       |
| 2        | Pablo Picasso    | 1881      | Spanish     |
| 3        | Frida Kahlo      | 1907      | Mexican     |

ArtistID is the primary key because it uniquely identifies each artist.

Table: Exhibitions

| ExhibitionID | ExhibitionName        | Location            | ArtworkID |
|--------------|-----------------------|---------------------|-----------|
| 1001         | Impressionist Masters | The Louvre, Paris   | 101       |
| 1002         | War and Peace in Art  | Reina Sofía, Madrid | 102       |
| 1003         | Surrealism and Beyond | MoMA, New York      | 103       |

ExhibitionID is the primary key because it uniquely identifies each exhibition.

ArtworkID is the primary key because it uniquely identifies each artwork.

Table: Artworks

| ArtworkID | Title          | YearCreated | ArtistID |
|-----------|----------------|-------------|----------|
| 101       | Starry Night   | 1889        | 1        |
| 102       | Guernica       | 1937        | 2        |
| 103       | The Two Fridas | 1939        | 3        |

A primary key is a unique identifier  
Only one per table.

# #2 Relational Database

Table: Artists

| ArtistID | Name             | BirthYear | Nationality |
|----------|------------------|-----------|-------------|
| 1        | Vincent van Gogh | 1853      | Dutch       |
| 2        | Pablo Picasso    | 1881      | Spanish     |
| 3        | Frida Kahlo      | 1907      | Mexican     |

Foreign Key

The tables are linked together using a foreign key (in table Artworks) referring to the primary key (in table Artists).

Table: Artworks

| ArtworkID | Title          | YearCreated | ArtistID |
|-----------|----------------|-------------|----------|
| 101       | Starry Night   | 1889        | 1        |
| 102       | Guernica       | 1937        | 2        |
| 103       | The Two Fridas | 1939        | 3        |

The tables are linked together using a foreign key (in table Exhibitions) referring to a primary key (in table Artworks).

Foreign Key

Table: Exhibitions

| ExhibitionID | ExhibitionName        | Location            | ArtworkID |
|--------------|-----------------------|---------------------|-----------|
| 1001         | Impressionist Masters | The Louvre, Paris   | 101       |
| 1002         | War and Peace in Art  | Reina Sofía, Madrid | 102       |
| 1003         | Surrealism and Beyond | MoMA, New York      | 103       |

A foreign key is used to create a relationship between two tables.

It is a column (or set of columns) in one table that refers to the primary key in another table.

This establishes a link between the records in the two tables.

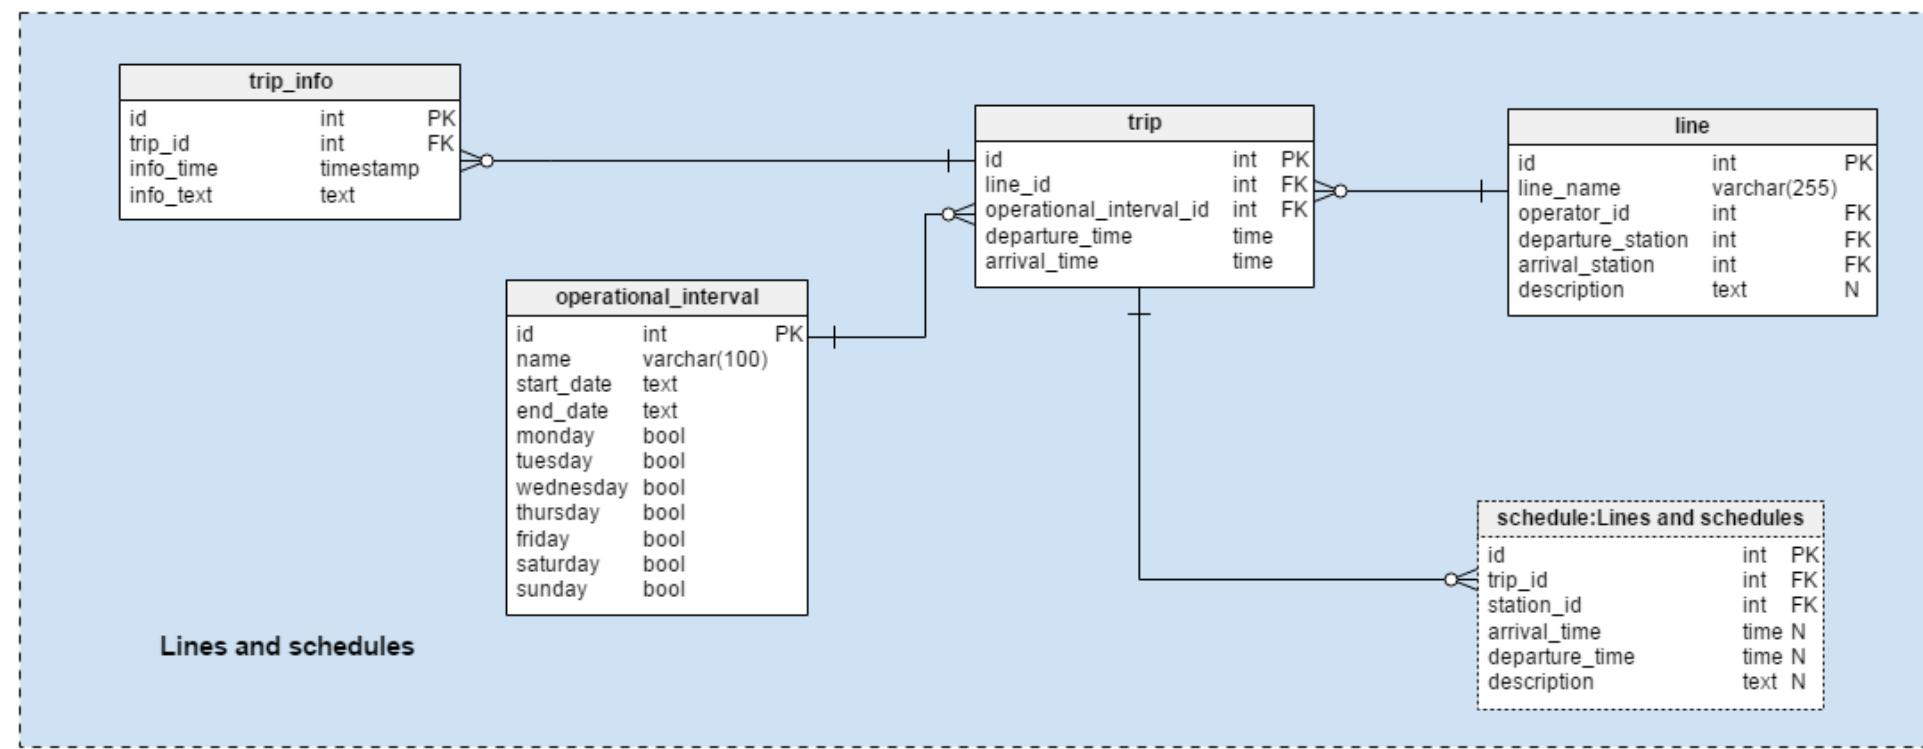

The action of creating and joining the tables...etc is done using SQL!

# #2 Relational Database

Data modelling is the process of diagramming data flows.

It provides a clear and structured visualization of how data is organized, stored, and related within a database.

With a clear understanding of how tables are related we can write more efficient SQL queries.

We can identify the correct tables to join, select the right columns, and apply filters more accurately, which improves the performance and accuracy of data retrieval.

Verkehrsplanung  
und Verkehrstechnik  
TU Darmstadt

# #2 Relational Database

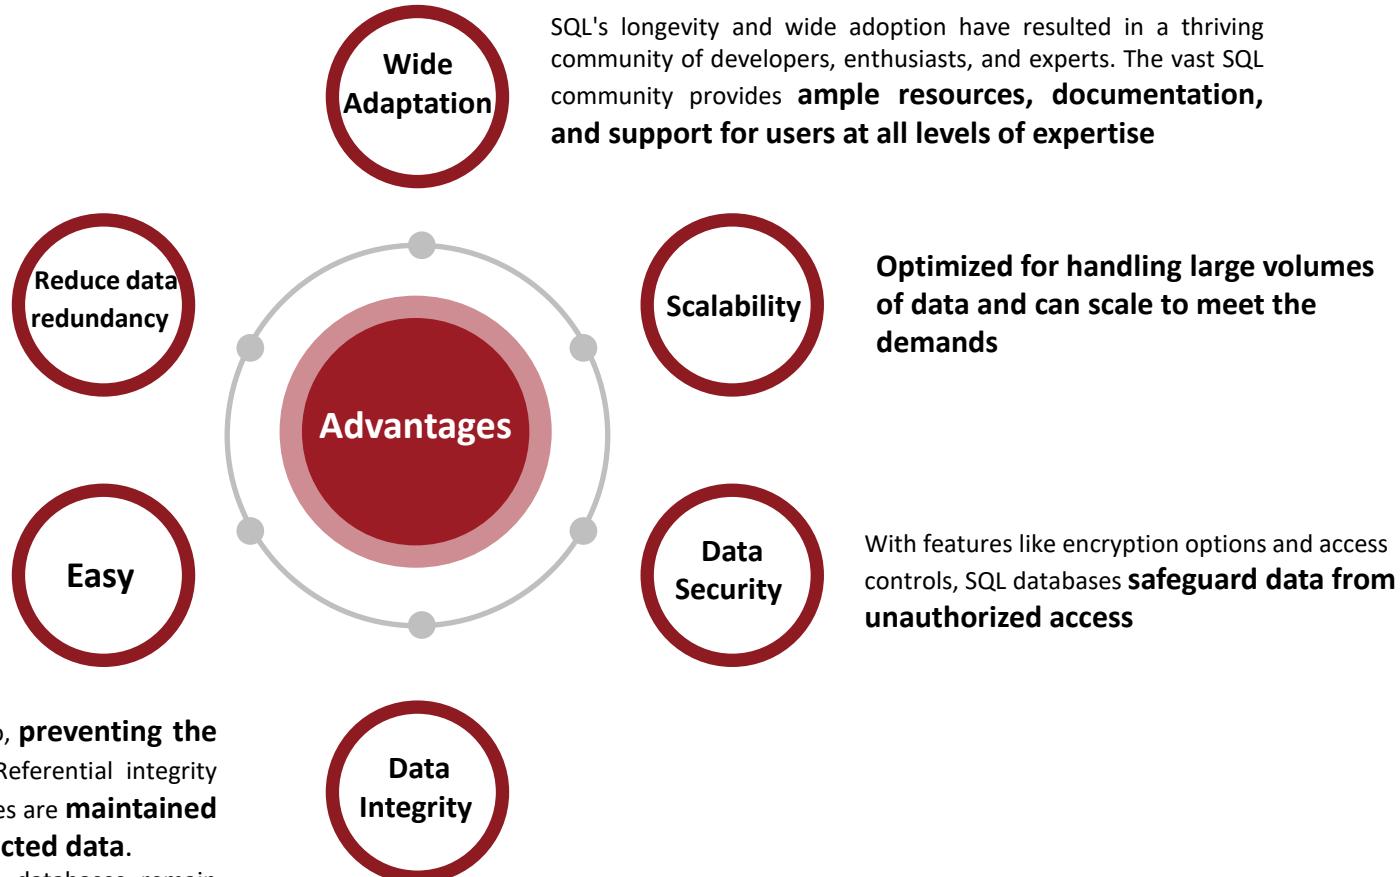

**Store each fact once** (e.g. station info in one table), then reuse it via keys instead of copying it everywhere.

**Easy data retrieval and manipulation**

Constraints define rules that data must adhere to, **preventing the entry of invalid or inconsistent data**. Referential integrity ensures that relationships between different tables are **maintained correctly, avoiding orphaned or disconnected data**.

By adhering to these essential principles, SQL databases remain accurate, reliable, and consistent

# #2 Relational Database

Why use relational databases in transportation planning and engineering?

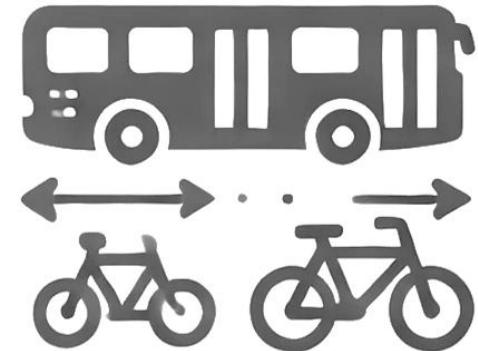

**Central, consistent storage** of lines, stops, trips, schedules, passengers, sensors, etc.

**Less redundancy, fewer errors** each station, line, vehicle stored once and reused.

**Easy data integration:** join many tables for example GPS logs + timetable + ridership).

**Powerful analysis with SQL:** filter, aggregate, and compare scenarios quickly.

**Scales and shares well:** many users, large datasets, dashboards and models all use the same trusted data.

## #2 Relational Database

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

Institut für  
Verkehrsplanung  
und Verkehrstechnik  
TU Darmstadt

Postgre**SQL**

There are many relational databases that use SQL (Structured Query Language) as their primary language for interacting with the database, such as **PostgreSQL**, **MySQL**, **SQLite**, and **SQL Server**. All share the same basic structure of standard SQL, and the key commands are generally similar.

**MySQL**™

# #3 SQL 101

- SQL is needed by anyone who needs to create, modify, or communicate with relational databases.
- Commands such as SELECT, UPDATE, INSERT, DELETE, and so on remain largely unchanged.

```
SELECT * FROM employees;
```

This query selects all columns from the "employees" table.

```
UPDATE employees SET salary = 50000 WHERE id = 1;
```

This updates the salary to 50,000 for the employee with ID 1.

```
INSERT INTO employees (name, salary) VALUES ('John Doe', 45000);
```

This inserts a new employee named John Doe with a salary of 45,000.

```
DELETE FROM employees WHERE id = 1;
```

This deletes the employee with ID 1 from the "employees" table.

# #3.1 SELECT FROM

## Basic syntax: SELECT and FROM

- There are two required ingredients in any SQL query: **SELECT** and **FROM**—and they have to be in that order.
- SELECT indicates which columns you'd like to view, and FROM identifies the table that they live in.
- **\* means get me all the columns in the specific table.**

The screenshot shows a Mode Studio interface with the following details:

- Top Bar:** scAlnce ERC > ASTRAI, Report, Share, View, Mode Studio, Upgrade your account.
- Left Sidebar:** ASTRAI, Report Builder, Add Notebook, DATA, Query 1 (selected), New chart.
- Central Area:** A code editor window titled "Query 1" containing the following SQL code:

```
1
2
3 SELECT *
4 FROM tutorial.flights
5
6 SELECT *
7 FROM tutorial.flights_revenue
```

A green "Succeeded" button is visible at the bottom right of the code editor.
- Bottom Area:** A data preview table with columns: Data, Fields, Source. The Data section shows 9 rows of flight data. The Fields section lists: actual\_arrival\_time, actual\_flight\_time, acutal\_departure\_time, air\_time, air\_traffic\_delay. The Source section lists: flights. A detailed description of the "flights" table is provided on the right, listing its columns and their types: actual\_arrival\_time (number), actual\_flight\_time (number), acutal\_departure\_time (number), air\_time (number), air\_traffic\_delay (number), airline\_code (string), airline\_name (string), arrival\_delay (string), cancellation\_reason (string).

# #3.1 SELECT FROM

The screenshot shows a website for SQL exercises. At the top, there's a navigation bar with links for Tutorials, References, Exercises (which is currently selected), Certificates, and a search bar. Below the navigation is a horizontal menu with links for HTML, CSS, JAVASCRIPT, SQL (selected), PYTHON, JAVA, PHP, HOW TO, W3.CSS, C, C++, C#, BOOTSTRAP, REACT, MYSQL, JQUERY, EXCEL, XML, and DJANGO. A sidebar on the left contains links for SQL Null Functions, SQL Stored Procedures, SQL Comments, SQL Operators, SQL Database, SQL Create DB, SQL Drop DB, SQL Backup DB, SQL Create Table, SQL Drop Table, SQL Alter Table, SQL Constraints, SQL Not Null, SQL Unique, SQL Primary Key, SQL Foreign Key, SQL Check, SQL Default, SQL Index, SQL Auto Increment, SQL Dates, SQL Views, SQL Injection, SQL Hosting, and SQL Data Types. The main content area is titled "SQL Exercises". It features a banner for "FeWo-direkt" showing a pool at night. Below the banner, there's a section titled "Ferienwohnungen für dich und deine Lieben" with a "Finde deine" button. The main content area is titled "SQL Exercises" and includes "Previous" and "Next" buttons. A section titled "Exercises" lists categories: Syntax (4 exercises), Select (5 exercises, highlighted with a red box), Select Distinct (5 exercises), Where (6 exercises), Order By (6 exercises), And (5 exercises), Or (5 exercises), Not (6 exercises), and Insert Into (4 exercises). Each category has an "Open" button to the right.

## #3.2 WHERE Filter

- The **WHERE** clause is used to filter records.
- It is used to extract only those records that **fulfill a specified condition**.
- Remember when using SQL, entire rows of data are **preserved together**. Meaning the operations typically affect entire rows of data, rather than individual columns or cells.
- The **clause order is important**. Therefore, writing what when is critical.
- The most basic way to filter data is using **1) comparison operators**.
- The easiest way to understand them is to start by looking at a list of them:

|                          |          |
|--------------------------|----------|
| Equal to                 | =        |
| Not equal to             | <> or != |
| Greater than             | >        |
| Less than                | <        |
| Greater than or equal to | >=       |
| Less than or equal to    | <=       |

# #3.2 WHERE Filter

The screenshot shows a Mode Studio interface with a query editor and a results table.

**Query Editor:**

```
1 SELECT *
2   | FROM tutorial.flights
3 WHERE origin_airport = 'JFK'
```

A white arrow points from the text "single quotes" in the sidebar to the single quotes around 'JFK' in the WHERE clause.

**Results Table:**

|   | origin_airport | origin_city | origin_state | scheduled_arrival_time | scheduled_departure_time |
|---|----------------|-------------|--------------|------------------------|--------------------------|
| 1 | 0              | JFK         | New York     | New York               | 1449                     |
| 2 | 0              | JFK         | New York     | New York               | 1810                     |
| 3 | 0              | JFK         | New York     | New York               | 1304                     |
| 4 | 0              | JFK         | New York     | New York               | 1101                     |
| 5 | 0              | JFK         | New York     | New York               | 1032                     |
| 6 | 0              | JFK         | New York     | New York               | 1642                     |
| 7 | 0              | JFK         | New York     | New York               | 1210                     |
| 8 | 0              | JFK         | New York     | New York               | 1428                     |
| 9 | 0              | JFK         | New York     | New York               | 1219                     |

# #3.2 WHERE Filter

2) **Logical operators** allow you to use multiple comparison operators in one query.

The screenshot shows a Mode Studio interface for a dataset named 'ASTRAI'. On the left, there's a sidebar with 'Report Builder' and 'Add Notebook' options under 'DATA', and 'Explore' and 'Where' sections under '+'. The main area displays a SQL query in a code editor:

```
1 SELECT *  
2   | FROM tutorial.flights  
3 WHERE origin_airport = 'JFK'  
4  
5  
6 SELECT airline_name,  
7       | origin_airport,  
8       | destination_airport,  
9       | air_traffic_delay,  
10      | day_of_week  
11     | FROM tutorial.flights  
12 WHERE origin_airport = 'JFK' AND destination_city = 'Atlanta'
```

The query has run successfully, indicated by a green checkmark and the word 'Succeeded'.

Below the code editor is a table view showing flight data for rows 88 to 96. The columns are: airline\_name, origin\_airport, destination\_airport, air\_traffic\_delay, and day\_of\_week. The data includes flights from JetBlue Airways and Delta Air Lines Inc. to Atlanta (ATL) on various days of the week.

On the right side, there's a sidebar titled 'Mode Public Warehouse (everyone)' with a search bar and a list of datasets:

- tutorial.nominee\_information
- animal\_crossing\_accessories
- billboard\_top\_100\_year\_end
- city\_populations
- crunchbase\_acquisitions
- crunchbase\_acquisitions\_clean\_date
- crunchbase\_companies
- crunchbase\_companies\_clean\_date
- crunchbase\_investments
- crunchbase\_investments\_part1
- crunchbase\_investments\_part2

At the bottom right, there's a detailed view of the 'flights' dataset schema:

| flights               | Type     |
|-----------------------|----------|
| # arrival_delay       | number   |
| T cancellation_reason | string   |
| # carrier_delay       | number   |
| @ day                 | datetime |
| # departure_delay     | number   |
| T destination_airport | string   |
| T destination_city    | string   |
| T destination_state   | string   |
| # distance            | number   |

## #3.2 WHERE Filter

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

Institut für  
Verkehrsplanung  
und Verkehrstechnik  
TU Darmstadt

Here are more logical operators:

- **LIKE** allows you to match similar values, instead of exact values.
- **IN** allows you to specify a list of values you'd like to include.
- **BETWEEN** allows you to select only rows within a certain range.
- **IS NULL** allows you to select rows that contain no data in a given column.
- **AND** allows you to select only rows that satisfy two conditions.
- **OR** allows you to select rows that satisfy either of two conditions.
- **NOT** allows you to select rows that do not match a certain condition.

What is the difference between zero and null value?

## #3.2 WHERE Filter

ASTRAI

Where

Run Selected Limit 100 Format View history

```
1 SELECT *  
2   | FROM tutorial.flights  
3 WHERE origin_airport = 'JFK'  
  
4  
5  
6  
7 SELECT destination_airport,  
8      | first_class_rev  
9     | FROM tutorial.flight_revenue  
10 WHERE first_class_rev BETWEEN 16000 AND 17000  
11  
12  
13  
14
```

Succeeded

Page 1 of 1 Showing rows 1-2 Columns Size Run a few seconds Executed in

# #3.3 ORDER BY Sorting

Once you've learned how to filter data, it's time to learn how to sort data. The **ORDER BY** clause allows you to **reorder your results** based on the data in one or more columns. The ORDER BY keyword sorts the records in **ascending order by default**. To sort the records in descending order, use the DESC keyword.

The screenshot shows a Mode Studio interface. On the left, there's a sidebar with 'ASTRAI' selected. Under 'DATA', 'Explore' is expanded, and 'Where' is selected. The main area contains a SQL query:

```
6 SELECT airline_name,
7      | origin_airport,
8      | destination_airport,
9      | air_traffic_delay,
10     | day_of_week
11    FROM tutorial.flights
12 WHERE origin_airport = 'JFK' AND destination_city = 'Atlanta'
13 ORDER BY day_of_week
```

The results table shows the following data:

|   | airline_name         | origin_airport | destination_airport | air_traffic_delay | day_of_week |
|---|----------------------|----------------|---------------------|-------------------|-------------|
| 1 | JetBlue Airways      | JFK            | ATL                 | 0                 | Friday      |
| 2 | Delta Air Lines Inc. | JFK            | ATL                 | 0                 | Friday      |
| 3 | JetBlue Airways      | JFK            | ATL                 | 26                | Friday      |
| 4 | Delta Air Lines Inc. | JFK            | ATL                 | 0                 | Friday      |
| 5 | Delta Air Lines Inc. | JFK            | ATL                 | 0                 | Friday      |
| 6 | Delta Air Lines Inc. | JFK            | ATL                 | 0                 | Friday      |
| 7 | JetBlue Airways      | JFK            | ATL                 | 0                 | Friday      |
| 8 | Delta Air Lines Inc. | JFK            | ATL                 | 0                 | Friday      |
| 9 | Delta Air Lines Inc. | JFK            | ATL                 | 0                 | Friday      |

On the right, there's a list of datasets and a search bar. A large red question mark icon is overlaid on the right side of the screen.

What changed?

## #3.4 AGGREGATION FUNCTIONS

TECHNISCHE  
UNIVERSITÄT  
DARMSTADT

Institut für  
Verkehrsplanung  
und Verkehrstechnik  
TU Darmstadt

- The functions themselves **are the same ones** you will find in Excel or any other analytics program.
- They all **aggregate across the entire table**.

Here are the aggregation functions:

- **COUNT** counts how many rows are in a particular column.
- **SUM** adds together all the values in a particular column.
- **MIN** and **MAX** return the lowest and highest values in a particular column, respectively.
- **AVG** calculates the average of a group of selected values.

# #3.4 AGGREGATION FUNCTIONS

The screenshot shows the Mode Studio interface for a dataset named 'ASTRAI'. The left sidebar lists 'Report Builder', 'Add Notebook', and three sections under 'DATA': 'AGGR' (selected), 'Explore', and 'Where'. The main area contains a query editor with the following SQL code:

```
1 SELECT SUM(first_class_rev) AS total_FC,
2        SUM(cargo_rev) AS total_cargo,
3        SUM(business_class_rev) AS total_BC,
4        SUM(coach_rev) AS total_coach
5 FROM tutorial.flight_revenue
```

The results are displayed in a table:

|   | total_fc | total_cargo | total_bc | total_coach |
|---|----------|-------------|----------|-------------|
| 1 | 225462   | 198808      | 140512   | 273218      |

Below the table, the status bar shows: << < Page 1 > >> Showing rows 1-1 Columns Size Run a few seconds Executed in

The right sidebar shows a list of connections under 'Mode Public Warehouse (everyone)':

- tutorial.flights
- animal\_crossing\_accessories
- billboard\_top\_100\_year\_end
- city\_populations
- crunchbase\_acquisitions
- crunchbase\_acquisitions\_clean\_date
- crunchbase\_companies
- crunchbase\_companies\_clean\_date
- crunchbase\_investments
- crunchbase\_investments\_part1
- crunchbase\_investments\_part2

A detailed view of the 'flight\_revenue' connection is shown on the right, listing its schema:

| Type | Name                | Type   |
|------|---------------------|--------|
| T    | destination_airport | string |
| #    | cargo_rev           | number |
| #    | first_class_rev     | number |
| #    | business_class_rev  | number |
| #    | coach_rev           | number |
| ?    | id                  | serial |

# #3.4 AGGREGATION FUNCTIONS

The screenshot shows a Mode Studio interface. At the top, there's a navigation bar with icons for user profile, 'AS', and 'scAlnce ERC > ASTRAI'. Below it, a report card shows 'Report' and 'Share' options. On the right, there are search and account upgrade buttons. The main area has tabs for 'Report Builder' and 'Add Notebook'. A sidebar on the left lists 'DATA' sections: 'AGGR' (selected), 'Explore', and 'Where'. The 'AGGR' section contains a query editor with two SQL queries:

```
1 SELECT SUM(first_class_rev) AS total_FC,
2     SUM(cargo_rev) AS total_cargo,
3     SUM(business_class_rev) AS total_BC,
4     SUM(coach_rev) AS total_coach
5 FROM tutorial.flight_revenue
6
7
8 SELECT MIN(first_class_rev) AS FC_lowest,
9     MAX(business_class_rev) AS BC_highest
10    FROM tutorial.flight_revenue
11
12
```

The status bar at the bottom indicates the query succeeded.

Below the editor is a data preview table with columns 'Data', 'Fields', and 'Source'. It shows two rows of data:

| Data | Fields               | Source |
|------|----------------------|--------|
| 1    | fc_lowest bc_highest |        |
| 1    | 11804 14455          |        |

At the bottom, there are buttons for 'Export' and 'Copy', and a footer showing page 1 of 1, rows 1-1, and execution time 'a few seconds'.

To the right of the preview, a sidebar shows 'Mode Public Warehouse (everyone)' with a search bar and a list of datasets:

- tutorial.flights
- animal\_crossing\_accessories
- billboard\_top\_100\_year\_end
- city\_populations
- crunchbase\_acquisitions
- crunchbase\_acquisitions\_clean\_date
- crunchbase\_companies
- crunchbase\_companies\_clean\_date
- crunchbase\_investments
- crunchbase\_investments\_part1
- crunchbase\_investments\_part2

Below this is a detailed view of the 'flight\_revenue' dataset:

| destination_airport  | string |
|----------------------|--------|
| # cargo_rev          | number |
| # first_class_rev    | number |
| # business_class_rev | number |
| # coach_rev          | number |
| ? id                 | serial |

A magnifying glass icon is located at the bottom right of the sidebar.

# #3.4 AGGREGATION FUNCTIONS

The screenshot shows a list of SQL exercises categorized under 'SQL'. A red box highlights the 'Count' and 'Sum' sections.

- Count (4 exercises)
- Sum (5 exercises)
- Avg (5 exercises)
- Like (9 exercises)
- Wildcards (8 exercises)
- In (6 exercises)
- Between (1 exercise)
